Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Spidermal growth factor receptor homolog precursor - rat

N.Alernate names: ErbB3 protein, HER3 protein
C.Species: Ratus norvegicus (Norway rat)

Ajaccession: 744-823 AMOS>
Ajacces splice form 1, called HIR-A, has a higher affinity for insulin than splice for
Ajacces splice form 1 is expressed in adult peripheral nerve, skin, kidney, striated majace spredominantly expressed in adult liver
2 is predominantly expressed in adult liver

C;Comment: The beta chain contains an ATP binding site, a tyrosine autophosphorylation
site for myristate on lysine.
C;Comment: Autophosphorylation increases kinase activity and makes it more insulin-ind

                                                                                      cell DNA
                                                                                                                                                                                                                                        -!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- MISCELLANBOOKS: Blinding of EGF to the receptor leads to dimerization, internalization of the EGF-receptor complex, induction of the tyrosine kinase activity, stimulation of cell synthesis, and cell proliferation.
-!- SIMILARITY: Belongs to the EGF receptor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  EXTERACELLULAR (POTENTIAL).

Varianian' T.;

"The epidermal growth factor receptor engages receptor interacting
protein and nuclear factor-kappa B (NZ-kappa B)-inducing kinase to
activate NF-kappa B. Identification of a novel receptor-tyrosine
T kinase signalosome.";

J. Biol. Chem. 276:8865-8874(2001).

L. PINCTION: Receptor for EGF, but also for other members of the EGF
family, as TGF-alpha, amphiregulin, betacellulin, heparin-binding
EGF-like growth factor, GP30 and vaccinia virus growth factor. Is
involved in the control of cell growth and differentiation.

C.-- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
EVROSINE Binds RIPK1. CBL interacts with the autophosphorylated
C-terminal tail of the EGF receptor.

C.-- SUBCELLULAR LOCATION: Type I membrane protein. Isoform 2 is

1. PUNCTION: THE EGF PECEPTOR MEDIATES THE BIOLOGICAL SIGNAL OF EGF.

AND ALSO OF TGF-ALPHA, AMPHIREGULIN, HEPARIN-BINDING EGF, GP30 AND VACCINIA VIRUS GROWTH FACTOR (BY SIMILARITY).

1. CATALYTIC ACTIVITY: ATP + a protein tyrosine a ADP + protein tyrosine phosphate.

1. SUBMITT: Binds RIPKI (By similarity).

1. SUBGELLULAR LOCATION: Type I membrane protein.

1. SUBGELLULAR LOCATION: Type I membrane protein.

1. SUBGELLULAR LOCATION: Type I membrane protein.

1. SUBGELLULAR LOCATION: App of the EGF-receptor complex, internalization of the EGF-receptor complex.

1. Induction of the tyrosine kinase activity, stimulation of cell DNA synthesis, and cell proliferation.

2. SIMILARITY: Belongs to the EGF receptor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. "Expression of neurequlins and their putative receptors, ErbB2 and ErbB3, is induced during Wallerian degeneration.";
J. Neurosci. 17:1642-1659(1937).
-!- FUNCTION: Specifically binds and is activated by neuregulins, NRG-2, NRG-3, heparint-binding EGP-like growth factor, betacillulin and NTAK. Interaction with these factors induces cell differenciation. Not activated by EGF, TGF-A, and amphiregulin (By similarity).

   tyrosine phosphate.
-!- SUBUNIT: Homodimer or heterodimer with each of the other BRBB receptors. Interacts with the PDZ domain of the syntrophin SNTB2 (By Similarity).
-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Preferentially expressed in the developing nervous system. Exhibits distinct and highly regionalized patterns of expression in the adult brain, where it is mainly found in the relicular nucleus of the thallamus. Very low levels in kidney, and heart.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               RECEPTOR PROTEIN-TYROSINE KINASE ERBB-4.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      at neuronal synapses.",

proc. Natl. Acad. Sci. U.S.A. 97:3596-3601(2000).

proc. Natl. Acad. Sci. U.S.A. 97:3596-3601(2000).

NRG-1- FUNCTION. Specifically binds and is activated by neuregulins, NRG-2, NRG-3, heparin-binding BGF-like growth factor, beracellulin and NTAK. Interaction with these factors induces cell differenciation.

Not activated by EGF. TGF-A, and amphiregulin.

Not activated ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Poy I., Neubauer M.G., Shoyab M.; "Ligand-specific activation of HER4/pl80erbB4, a fourth member of the epidermal growth factor receptor family,"; Proc. IISOUS SPECIFICITY: Epithelial tissues and brain.
DOMAIN: THE CYTOPLASMIC PART OF THE RECEPTOR MAY INTERACT WITH THE
SH2 OR SH3 DOMAINS OF MANY SIGNAL-TRANSDUCING PROTEINS.
PIM. LIGAND-BINDING INCREASES PHOSPHORYLATION ON TYROSINE RESIDUES
AND PROMOTES ITS ASSOCIATION WITH THE P85 SUBDNIT OF
PHOSPHATIDYLINOSITOL 3-KINASE (BY SIMILARITY)
DISBASE: OVERANDESSED IN a subset of human mammary tumors.
SIMILARITY: Belongs to the EGF receptor family.

Isold=P04412-2; Sequence=VSP 002897;
ISSUE SPECIFICITY: UBIQUITOUSLY EXPRESSED IN EMBRYOS. IN LARVAE,
UNIFORM EXPRESSION IS SEEM IN WING DISKS, GENITAL DISK, ANIAGEN OF
TESTIS AND OVARY, AND BRAIN CORTEX. IN EYE-ANTENNA DISK, HIGHEST
EXPRESSION IS ANTERIOR TO MORPHOGENETIC FURROW, LEVELS REMAIN HIGH
IN PHOTORECEPTOR PRECURSOR CELLS. THIS PATTERN IS REVERSED IN
POSTERIOR EYE DISK. IN ADULTS EXPRESSION IS HIGH IN BRAIN CORTEX
AND THORACIC AND ABDOMINAL GANGLIA.
SIMILARITY: Belongs to the EGF receptor family.
                                                                                                                                                                                                                       SEQUENCE OF 1133-1137; 1155-1167 AND 1209-1216 FROM N.A., AND MUTATION
                                                                                                                                                                                                                                      ANALYSIS.

Biol. Cell 10:2087-2100(1999).

-!- FUNCTION: Tyrosine kinase receptor required for the induction of vulval differentiation. Possible receptor for the inductive signal required for vulval development. Activated by lin-3 and acts by way of let-60 RAS. The lin-3/let-23 pair is a simplified version of the mammalian neuregulin-ERBB network.

-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Aroian R.V., Les G.M., Sternberg P.N.;

--- TISSUE SPECIFICITY: Vulval precursor cells.
--- DEVELOPMENTAL STRAGE: Expressed during L2 and L3 larval stages.
---- SIMILARITY: Belongs to the EGF receptor family.

SUBUNIT: Tetramer of 2 alpha and 2 beta chains linked by disulfide bonds. The alpha chains contribute to the formation of the ligand-binding domain, while the beta chains carry the kinase domain. SUBCELUMLAR LOCATION: Type I membrane protein.
SUBCELUMLAR LOCATION Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   MEDLINE=8659667; PubMed=3014506;

Steele R.E., Mai N.H., Lieu P., Shenk M.A.;
Submitted (APR-1991) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: THIS RECEPTOR PROBABLY BIRDS AN INSULIN RELATED PROTEIN
AND HAS A TYROSINE-PROTEIN KINASE ACTIVITY (BY SIMILARITY).
-!- CATALYIIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
tyrosine phosphate.
-!- SUBCELLULAR LOCATION: Type I membrane protein (By similarity).
-!- TISSUE SPERSETIOTY: EXPRESSED IN DIVIDING EPITHELIAL CELLS.
-!- TROSUE SPERITY: Belongs to the Tyr family of protein kinases. Insulin receptor subfamily.

insulin receptor substrates IRS-1 and IRS-2.
-!- CATALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein tyrosine phosphate property. ATP + a protein tyrosine = ADP + protein tyrosine phosphate property. PROBABLE TETRAMER OF 2 ALPHA AND 2 BETA CHAINS LINKED BY DISULFIDE BONDS. THE ALPHA CHAINS CONTRIBUTE TO THE PORMATION OF THE LIGAND-BINDING DOMAIN, WHILE THE BETA CHAIN CARRY THE KINASE DOMAIN (By similarity).
-!- SUBCELLUTAR LOCATION: Type I membrane protein (By similarity).
-!- TISSUE SPECIFICITY: Highly expressed in the islets as well as in pancreatic bera-cells.
-!- SIMILARITY: Belongs to the Tyr family of protein kinases. Insulin receptor subfamily.
-!- SIMILARITY: Contains 3 fibronectin type III domains.
```

"The application of the polymerase chain reaction to cloning members of the protein tyrosine kinase family.";

Gene 85:67-74 (1989).

-!- FUNCTION: THIS RECEPTOR BINDS INSULIN-LIKE GROWTH FACTOR I (IGF I) WITH A HIGH APPINITY AND IGF II WITH A LOWER AFFINITY. IT HAS A TYROSINE-PROTEIN KINASE ACTIVITY.

-!- CAPALYTIC ACTIVITY: ATP + a protein tyrosine = ADP + protein 

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                | 22;<br>663<br>1110<br>1110<br>1170<br>1170<br>1157<br>1157<br>1157<br>1157                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

Invended the protochordate amphioxus...;
Thomologue of PC6 in the protochordate amphioxus...;
Biochim. Biophys. Acta 1477:338-348(2000).

I. FUNCTION: Likely to represent a widespread endoprotease activity within the constitutive and regulated secretory pathway. Capable of cleavage at the RX (K/R)R consensus motif (By similarity).

C.-I. CATALYTIC ACTIVITY: Release of mature socif (By similarity).

C. CATALYTIC ACTIVITY: Release of Anga-Kaa-Rach-Zaa bonds, where Xaa can be any amino acid and Yaa is Arg or Lys.

C. SUBCELLULAR LOCATION: ISOFORM A AND ISOFORM C ARE SECRETED.

ISOFORM B IS A TYPE I MEMBRANE PROTEIN.

"Murine subtilisin-like proteinase SPC6 is expressed during embryonic implantation, somitogenesis, and skeletal formation.";

Dev. Genet. 21:75-81(1997).

-1- FUNCTION: Likely to represent a widespread endoprotease activity within the constitutive and regulated secretory pathway. Capable of cleavage at the RX IK/R) consensus motif. May be responsible of cleavage at the RX IK/R) consensus motif. May be responsible of cleavage at the RX IK/R) consensus motif. May be involved in the cellular prodiferation of adrenal cortex via the activation of gastrointestinal peptides. May be involved to the maturation of gastrointestinal peptides. May be involved to the maturation of adrenal cortex via the activation of growth factors.

-1- CATALIVITY: Release of mature proteins from their or subcellular LOCATION: PCSA IS SECRETED THROUGH THE REGULATED SECRETORY PATHWAY. PCSB IS A TYPE I MENBRANE PROTEIN LOCALIZED TO A PARAWICLEAR POST-GOLGI NETWORK COMPARTMENT IN COMMUNICATION WITH EARLY ENDOCRA:

-1- ALTERNATIVE RODUCTS.

```
sac followed by a confination to dermamyotome compartment. Between e9.5 and E11.5, abundant expression in AER (thickened ectodermal cells of limb buds). At E12.5, expression in the limbs is confined to the condensing mesenchym surrounding the cartilage. At this stage, strong expression also detected in vertebral and facial cartilage primordia and in the muscle of the tongue. At E16.5, abundant expression in epithelial cells of the intestinal vill. Isoform A is most abundant at all stages but significant levels of isoform B occur at E12.5.

-!- DOWALN: The propeptide domain acts as an intramolecular chaperone assisting the folding of the zymogen within the endoplasmic reticulum.

-!- DOMALN: AC 1 and AC 2 (clusters of acidic amino acids) contain sorting information. AC 1 directs TGN localization and interacts with the TGN sorting protein PACS-1.

-!- SIMILARITY: Belongs to peptidase family SB.
